Balance beam - which side of the scales is heaviest?

This is a series of 5 distance learning Google Forms each with 8 practice questions on identifying which side of a balance beam (set of scales) has the heaviest weights.

A balance beam (set of scales) is depicted graphically with a series of weights on either end. Simply determine what will happen to the balance beam. Will it fall to the left (more weight on the left side), will it fall to the right (more weight on the right side) or will it balance evenly (equal weight on either side)? Three multi-choice options are provided with bold and clear graphics. Just click on the image that corresponds to your prediction to submit your response.

There are 5 Google Forms included in this virtual learning weights and measures pack. Each question on each form features a set of scales and one or more specific weights of 1Lb, 2Lb, 5Lb, 10Lb, 20Lb and 50Lb:

- Balance beam (Lb) a - weights up to 2Lb
- Balance beam (Lb) b - weights up to 5Lb
- Balance beam (Lb) c - weights up to 10Lb
- Balance beam (Lb) d - weights up to 20Lb
- Balance beam (Lb) e - weights up to 50Lb

Balance Beam (Lb) a - weights up to 2Lb

Study each balance beam closely. Determine which side, if any, has the most weight. Will the beam fall to the left, to the right or will it balance evenly?

* Required

Enter your name or ID here: *

Your answer

A1. Which way will the balance beam fall? * 1 point

To the LEFT

To the RIGHT

Balances EVENLY

A2. Which way will the balance beam fall? * 1 point

Balance Beam (Lb) b - weights up to 5Lb

Study each balance beam closely. Determine which side, if any, has the most weight. Will the beam fall to the left, to the right or will it balance evenly?
